No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                           Score

                                                                                                                            Query Match
                                                                                                                                                                  The present invention describes a raffinose synthase, having an activity of forming raffinose from sucrose and galactinol. The raffinose synthase gene can be used for expression in a plant for the production of raffinose. The raffinose synthase can give raffinose from sucrose and galactinol efficiently. The present sequence represents a raffinose synthase can give raffinose from sucrose and galactinol efficiently.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Raffinose synthase forms raffinose from sucrose and galactinol, he an optimum pH of 6 to 8 and working temperature of 35 to 40 degree C, has a molecular weight of 75 to 95 kDa by gel filtration or 90 to 100 kDa by PAGE and SDS-PAGE under reductive conditions and is inhibited by iodoacetamide, N-ethylmaleimide and myoinositol.

                                                                   Query Match
                                                                                                                          The present invention relates to a mutant protein of raffinose synthase in which at least one aromatic amino acid present at the position of about 1-7 amino acids from the N-terminus is deletted or replaced. The mutant protein can be used for reducing the raffinose oligosaccharide content in a plant body. The present protein from soybean, was used in the present protein from soybean.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a raffinose synthase, having an activity of forming raffinose from sucrose and galactinol. The raffinose synthase gene can be used for expression in a plant for the production of raffinose. The raffinose synthase can give raffinose from sucrose and galactinol efficiently. The present sequence represents raffinose

The raffinose synthetase is capable of producing raffinose by combining a D-galactosyl group through an alpha (1-6) bond with a hydroxyl group attached to the carbon atom at position 6 of a D-glucose residue in a sucrose molecule. The DNA can be used to modify metabolism of a host organism by introducing into the host organism or its cell so that the content of the raffinose family oligosaccharides in the host organism or cell is changed. Raffinose oligosaccharides are useful as food additives with beneficial effects on the gastrointestinal flora.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid molecule encoding plant raffinose synthetase capable of producing raffinose, used as food additives with beneficial effects on gastrointestinal flora

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a raffinose synthase protein. The sequence is isolated from plant material. The protein forms raffinose by complexing alpha(1 to 6)- D-galactosyl hydroxyl group of the 6C of D-glucose residue in sucrose molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 8; Page 25-27; 40pp; Japanese.

                                                                                                                                                                                                                                         This sequence represents the broad bean raffinose synthetase of the invention. The raffinose synthetase is capable of producing raffinose by combining a D-galactosyl group through an alpha (1-6) bond with a hydroxyl group attached to the carbon atom at position 6 of a D-glucose residue in a sucrose molecule. The DNA can be used to modify metabolism of a host organism by introducing into the host organism or its cell so that the content of the raffinose family oligosaccharides are useful as food additives with beneficial effects on the gastrointestinal flora.

                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a raffinose synthase protein. The sequence is isolated from plant material of broad beans. The protein forms raffinose by complexing alpha(1 to 6)- D-galactosyl hydroxyl group of the 6C of D-glucose residue in sucrose molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New
Nucleic acids and encoded proteins involved in the biosynthesis of raffinose, useful for producing soybean seeds with a reduced raffinose content and therefore improved nutritional quality -

Raffinose synthase is involved in the blosynthesis of raffinose and higher homologues in the raffinose saccharide family from sucrose. The present sequence is useful for reducing the raffinose saccharide content of soybean seeds which improves the nutritional quality of the soy protein products derived from them.
          This sequence represents sugarbeet raffinose synthase, a protein that can bind a D-galactosyl group through an alpha(1-6) bond to thydroxy group attached to the carbon atom at the 6-position of the D-glucose residue in a sucrose molecule to form raffinose. cDNA (see AAZ20208) encoding the enzyme was isolated from sugarbeet contaming leaf cDNA by PCR. Probes or primers generated from plant raffinose synthase genes (see AAZ20207-10) may be used to obtain
                                                                                                     Claim
                                                                                                                                                                                                                                                                                                                                                                                Misc-difference

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                 The present sequence is a raffinose synthase from clone rls24 pk0017,g10 isolated from a rice infected leaf cDNA library rls24. Raffinose synthase is involved in the biosynthesis of raffinose and higher homologues in the raffinose saccharide family from sucrose. The present sequence is useful for reducing the raffinose saccharide content of soybean seeds which improves the nutritional quality of the soy protein products derived from them.
                                                                                                                    Claim 2; Page 40-42;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Rice;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rice
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (claimed). These genes may be used to control the levels of raffinose produced in plants. Antisense genes can be used to knock out existing gene activity, and sense genes to increase the level of gene activity. The resulting transgenic plants may be used as a food source to alter the growing conditions for gut enterobacteria, providing general health advantages.
